Glucose, BloodPressure, SkinThickness, Insulin, BMI columns have values 0 which does not ake sense , hence are missing values

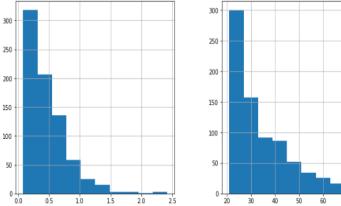

```
In [13]:
    data_copy = data.copy(deep = True)
    data_copy[['Glucose', 'BloodPressure', 'SkinThickness', 'Insulin', 'BMI']] = data_copy[['Glucose', 'BloodPressure', 'SkinThickness']
```

To fill these Nan values the data distribution needs to be understood

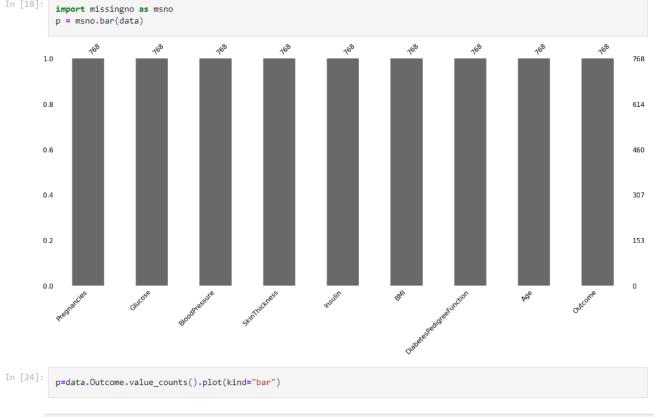

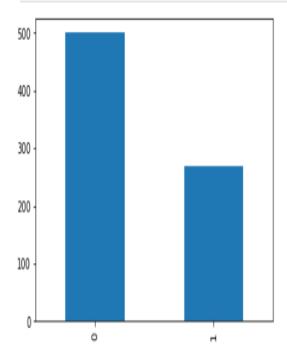

In [18]: import missingno as msno
 p = msno.bar(data)

The above graph shows that the data is biased towards datapoints having outcome value as 0 where it means that diabetes was not present actually. The number of non-diabetics is almost twice the number of diabetic patients
